

Panel Management and the Provincial Attachment System (PAS)

PAS Process

Panel Management Process

Once you are confident your panel is accurate and up to date, you can add it to PAS by submitting \$0 attachment code (98990) for each patient.

Submit to PAS

Empanelment

Search your EMR to identify your active patients and update status' to ensure your patient panel accurately reflects who you are responsible for. This will enable you to know which patients are attached to you as a provider and which ones to submit to PAS.

Building Registries

Phase 2 of the panel process starts by looking at what conditions the patients in your panel have and grouping them by common condition by ICD-g code. This enables a better understanding of your patient's needs at a population level.

Proactive and Preventative Care

Use your EMR to work for you and set up workflow processes to provide consistent proactive and preventative care to your panel of patients.

Panel Maintenance

Ensure your PAS and EMR are in sync and that both accurately represent your panel. Continue to code patients to accurately represent their care needs and enable reporting and automated EMR processes for proactive care

Keep patient status' and diagnostic codes up to date as you go and check in every 6 months to do a review and capture any missed data points.

At a minimum, you should update your patient panel in PAS every quarter.

- Option 1 (**recommended**): As you accept new patients or patients leave your panel, update PAS by submitting the 98990 attachment code (new patients) and removing patients directly within PAS.
- Option 2: Every 3 months (quarterly) review your panel within your EMR and ensure it matches your PAS panel registry by adding or removing patients from PAS.

Update PAS
